

## Homework 1

## Overview

Due: 21 Jan 2026

- Unless otherwise directed, please derive and show your work.
- Do not try to search directly for the answers.
- You may speak to other students about the assignment at a high-level (e.g. sharing related references/slides).
- However, sharing complete or partial answers is strictly prohibited.
- Please see the *UNC Student [Code of Conduct](#)* for additional details on maintaining academic integrity

## Part 1: Documentation of ML Implementation

- For **this problem** you are welcome to **choose documentation** from **any** programming **language** (*R, Python, Julia, MATLAB*, etc.) in which an **implementation** of a **machine learning** (ML) method is discussed
- During the **first units** of the course, you have been **exploring** a variety of **concepts** from **calculus, probability, statistics, and linear algebra** that support **multiple methods** in **machine learning** methods and **algorithms**
- In this problem you are asked to **compare documentation** from **two** different **implementations** of any **ML method** or **algorithm** related to any of the **fundamental concepts** discussed in *Units 1 and 2*

## A. (10 pts)

- **Include** a direct link to the **documentation** for the **two implementations** you selected
- These two **implementations** may come from **different** programming **languages**, or **different** library/**packages** in the **same** programming **language**
- Please **summarize** in **2 – 3 sentences** some high-level **differences** that you notice between the **two implementations**

**B. (6 pts)**

- From the **method** you selected in **part 'A'**, list a research **article** from **any domain**) in which the **ML method** of your choice has **been used**
- Include **title, authors, abstract**, and a direct **link** to the specific **article**

**Part 2: Eigendecomposition**

- For this problem you can **create** a **sample matrix** (following the stated properties) of your choice to **solve** problems **numerically**, **OR write** down the **mathematical expression(s)** for **solutions/proofs** in each case
- Suppose that  $A \in \mathbb{R}^{n \times n}$  can be **written** down as  $A = QDQ^T$  where  $D \in \mathbb{R}^{n \times n}$  is a **diagonal matrix** and  $Q^{-1} = Q^T$
- If you **want** to **solve** this problem **computationally**, you could use **this** sample **matrix**:

$$A = \begin{bmatrix} 13 & -4 & 2 \\ -4 & 11 & -2 \\ 2 & -2 & 8 \end{bmatrix}$$

- Confirm that the **matrix decomposition** below returns **A** (that is, verify that the product of  $QDQ^T$ :

$$A = \begin{bmatrix} \frac{\sqrt{5}}{3} & -\frac{2}{3\sqrt{5}} & 0 \\ -\frac{4}{3\sqrt{5}} & -\frac{2}{3} & \frac{1}{\sqrt{5}} \\ \frac{2}{3\sqrt{5}} & \frac{1}{3} & \frac{2}{\sqrt{5}} \end{bmatrix} \begin{bmatrix} 17 & 0 & 0 \\ 0 & 8 & 0 \\ 0 & 0 & 7 \end{bmatrix} \begin{bmatrix} \frac{\sqrt{5}}{3} & -\frac{4}{3\sqrt{5}} & \frac{2}{3\sqrt{5}} \\ -\frac{2}{3} & -\frac{2}{3} & \frac{1}{3} \\ 0 & \frac{1}{\sqrt{5}} & \frac{2}{\sqrt{5}} \end{bmatrix}$$

**A. (8 pts)**

- show that **A** is **symmetric**

**B. (8 pts)**

- show that  $QDQ^T$  is the **Eigendecomposition** of **A**
- That is, **show** that the **columns** of **Q** are **eigenvectors** of **A** (and **specify** corresponding **eigenvalues**)

**C. (8 pts)**

- write out the **Eigendecomposition** of  $A + \lambda I$  for some  $\lambda > 0$

**D. (8 pts)**

- **read** the **data** stored in the [Advertising.csv](#) in a matrix **B**

	<ul style="list-style-type: none"> <li>• <b>compute <math>B^T B</math> and report any two properties of the resulting matrix (e.g. eigenvalues, trace, determinant, singular value decomposition, largest eigenvalue, etc.)`</b></li> </ul>
<b>Part 3: Probability of Statistics Basics</b>	
<b>A. (12pts)</b>	<ul style="list-style-type: none"> <li>• <b>assume</b> that you are <b>tasked</b> with <b>building</b> a simple <b>binary classifier</b> that will eventually <b>predict</b> whether a user will <b>click</b> on an <b>ad</b> (<b>yes/no</b>)</li> <li>• right now, you do <b>not</b> have a <b>model</b> but only <b>historical click</b> rates.</li> <li>• suppose that the <b>historical click-through rate (CTR)</b> is <b>0.3</b></li> <li>• <b>in this problem</b> you will <b>simulate</b> user <b>behavior</b> and <b>observe</b> how the <b>estimated CTR</b> varies across <b>samples</b></li> </ul>
<b>i.</b>	<ul style="list-style-type: none"> <li>• <b>simulate 1000 users</b> using the <b>binomial distribution</b></li> <li>• each <b>user</b> has a <b>0.3 probability</b> of <b>clicking</b></li> </ul>
<b>ii.</b>	<ul style="list-style-type: none"> <li>• now, <b>simulate 1000 experiments</b>, each with <b>100 users</b></li> <li>• <b>plot the distribution of estimated CTRs</b> to see the <b>variability</b></li> </ul>
<b>iii.</b>	<ul style="list-style-type: none"> <li>• <b>comment</b> on your <b>results</b></li> </ul>
<b>B. (12 pts)</b>	<ul style="list-style-type: none"> <li>• <b>suppose</b> that a medical <b>test</b> for a <b>disease</b> has the <b>following characteristics</b>:             <ul style="list-style-type: none"> <li>○ <b>sensitivity</b> (true <b>positive</b> rate): <b><math>P(\text{test+} \text{disease+}) = 0.95</math></b></li> <li>○ <b>specificity</b> (true <b>negative</b> rate): <b><math>P(\text{test-} \text{disease-}) = 0.90</math></b></li> <li>○ <b>prevalence</b>: <b><math>P(\text{disease+}) = 0.02</math></b></li> </ul> </li> </ul>
<b>i.</b>	<ul style="list-style-type: none"> <li>• <b>calculate the probability</b> that a person <b>has the disease</b> given that they <b>test positive</b>: <b><math>P(\text{disease+} \text{test-})</math></b></li> </ul>
<b>ii.</b>	<ul style="list-style-type: none"> <li>• <b>calculate the probability</b> that a <b>person</b> does not have the <b>disease</b> given that they test <b>negative</b> <b><math>P(\text{disease-} \text{test-})</math></b></li> </ul>
<b>iii.</b>	<ul style="list-style-type: none"> <li>• <b>simulate a population of 100,000 people</b> and <b>empirically estimate</b> these probabilities</li> </ul>

	<ul style="list-style-type: none"> <li>• <b>compare</b> your <b>results</b> to the theoretical <b>calculations</b></li> <li>• <i>the <b>theoretical</b> and <b>empirical results</b> should <b>closely match</b></i></li> </ul>
<b>C. (8 pts)</b>	<ul style="list-style-type: none"> <li>• let <math>N(x   \mu, \Sigma) = (2\pi)^{-k/2} \det(\Sigma)^{-1/2} \exp(-1/2 (x - \mu)^T \Sigma^{-1} (x - \mu))</math> be the <b>multivariate normal</b> for <math>x^2 \in \mathbb{R}^d</math> with mean <math>\mu</math> and covariance <math>\Sigma</math></li> <li>• <i>suppose further that <math>\Sigma</math> is a <b>diagonal</b></i></li> <li>• show, for <b>diagonal covariance</b>, that <math>N(x/\mu, \Sigma)</math> is an <b>independent distribution</b> over the <b>dimensions</b> of <math>x</math></li> </ul>
<b>if solving the problem numerically</b>	<ul style="list-style-type: none"> <li>• Define the <b>multivariate normal distribution</b> with a <b>diagonal covariance</b> matrix using <code>`np.diag()`</code></li> <li>• Show that the <b>distribution</b> is <b>independent</b> over the <b>dimensions</b> by <b>demonstrating</b> that the <b>joint PDF</b> can be <b>written</b> as the <b>product</b> of the <b>individual PDFs</b> for each <b>dimension</b></li> <li>• <i>Create a <b>function</b> to <b>calculate</b> the <b>multivariate normal PDF</b> and use a <b>loop</b> to <b>evaluate</b> it for different <b>values</b> of the <b>variable</b></i></li> </ul>
<b>Part 4: Gradients</b>	
<b>A. (8 pts)</b>	<ul style="list-style-type: none"> <li>• suppose there is a function <math>f(\theta)</math> with gradient <math>\nabla_{\theta} f</math></li> <li>• <i>based on some current <b>value</b> of the <b>input</b>, <math>\theta_0</math>, <i>what is an update that will <b>yield</b> a <math>\theta_1</math> such that <math>f(\theta_0) \geq f(\theta_1)</math>?</i></i></li> </ul>
<b>B. (4 pts)</b>	<ul style="list-style-type: none"> <li>• using <b>'A'</b>, <b>derive</b> an iterative <b>algorithm</b> to <b>minimize</b> <math>f</math> <i>with respect to</i> <math>\theta</math> when starting <i>with</i> <math>\theta_0</math></li> </ul>
<b>C. (12 pts)</b>	<ul style="list-style-type: none"> <li>• <i>consider the code-block below</i></li> <li>• use the <b>algorithm</b> in <b>'B'</b> to minimize <math>f(\theta) = \ \theta\ _2^2 - 2v^T \theta</math>, where <math>\theta \in \mathbb{R}^3</math> and <math>v = [0.2, 0.1, 0.3]^T</math></li> </ul> <pre> 1 import numpy as np 2 import matplotlib.pyplot as plt 3 4 def loss(theta): 5     v = np.array(object=[0.2, 0.1, 0.3]) 6     return np.linalg.norm(x=theta)**2 - 2*v.dot(theta) </pre>

```
1 theta = np.array(object=[1.0, 0.0, 0.0])
2 losses = []
3
4 for i in range(stop/100):
5     theta = None # TODO implement update <<<<<<<<<
6     losses.append(object/loss(theta=theta))
7
8 #plt.plot(losses)
9
10 #print(theta)
```
